

Having **Leaked** Vacuum Sealed Bag Issues?

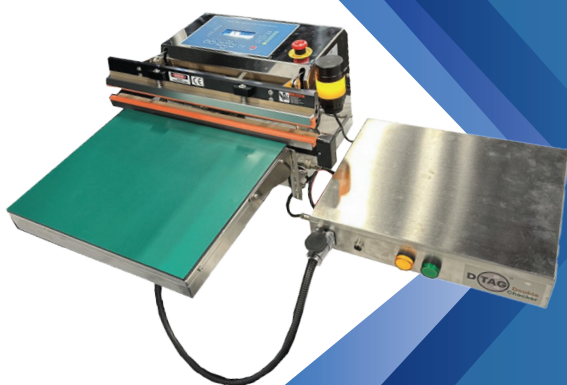

We have a solution for YOU!

D-TAG® Leak Detector is a light-weight and compact device that is designed to detect a leaked vacuum sealed bag. Together with our comprehensive Double Checker & EAS Gate Sensors, you can detect and rectify this problem before sending your package to your customers. This will help you to save time, money and rework costs that is due to leaked bag problem.

To ensure a seamless system, we have developed a Double Checker to work together with your vacuum sealer to make sure it works well with our leak detector.

With the Double Checker System, you can be sure that the leak detector works well when vacuum packed in the bag. It also make sure that the user does not over vacuum (too tight) the bag and cause potential puncture holes on the bag. This is one of the common causes of bag leakage that we have come across frequently.

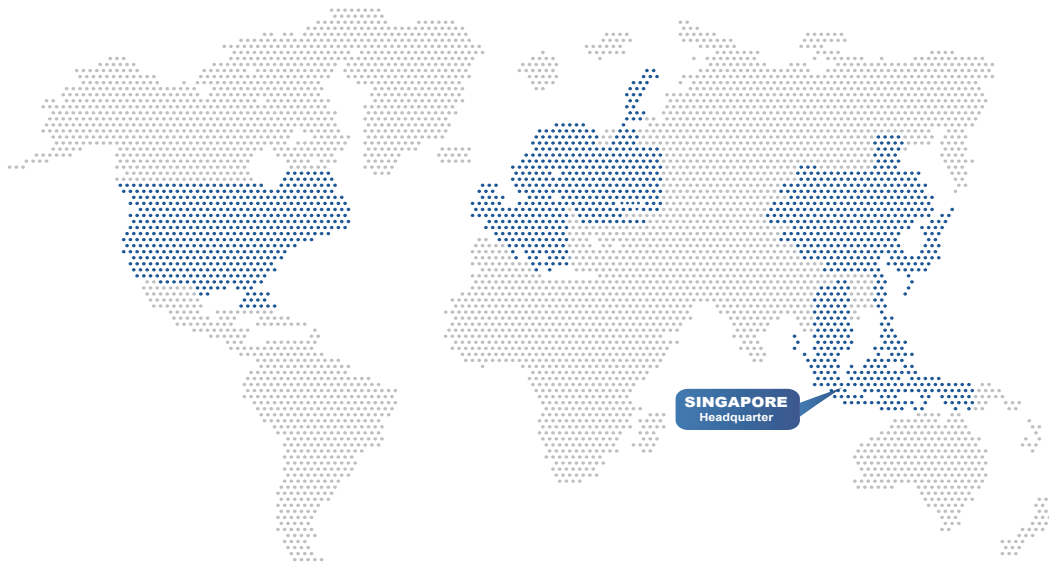

The pair of EAS Gate sensors are to be installed at the exit door/area of your production or warehouse area to detect any leaking bag in the carton boxes. If there is any leaking bag, the EAS Gate sensors will alarm and lighted up to warn of leaking bag(s) passing through them. In this case, you can detect and rectify the issue before sending the faulty goods to your customer.
